

Q
3

I would chose $k^* = 5$

rates for k^*-2, k^*+2 . are both 86%

When k is too small, prediction is under-fit and
not that accuracy

When k is too large, prediction is over-fit
not that accuracy

(b) I found learning-rate = 0.2
iteration = 300 work best

(c) please see q2.2-entropy.jpg

I would choose less iteration since it's already converge
